Elegram-api it's a wrapper over the telegram bots api, but in the style of EO. More object-oriented, more maintainable. ## Concept This is a concept, if you have ideas, feel free to create an issue!

```java
new Bot(
  "your token",
  new TxtCommand(
    "start",
    new RpPicture(
      "image.png",
      new RpText("Hi body!")
    )
  ),
  new TxtCommand(
    "help",
    new RpText("I'll help you!")
  )
).start();
```

Why this project exist?

This project solves the problem of the existing telegram-bots-api, which for some reason isn't *"Object-Oriented"*, here we can create a wrapper around the original API and make it more *"Object-Oriented"*.

What do I mean when I say object-oriented? > So let's look at cactoos library, I think you get the idea. ## How to Contribute Fork repository, make changes, send us a pull request. We will review your changes and apply them to the `master` branch shortly, provided they don't violate our quality standards. To avoid frustration, before sending us your pull request please run full Maven build:

```
mvn clean install
```

You will need Maven 3.3+ and Java 8+ installed ## Reasons to reject your code - Empty lines. - Compound names. - Incorrect formatting. - Mutability. - Getters/Setters. - Static methods. - Pull request with feature but without a unit-tests

This little list is to make you understand that **we aren't picking on you**, it's just a **level of quality below which we can't accept**.

Looking forward to your pull-request!
